

Power Tools for the high-tech classroom

Multimedia stimulates the imagination and brings subjects to life so students learn more. Telecenter IP's straightforward browser interface allows teachers to harness this power by combining multiple media resources into a single lesson plan.

- Reach more students by appealing to different learning styles through multimedia
- Increase retention by involving students using audio and video
- Combine multimedia with lectures to keep the interest and focus of students

Effective technology

The key to effective technology is making it both familiar yet flexible enough to accommodate different teaching and learning styles. Staff training is minimized since Telecenter IP is easy-to-learn and operate. Most teachers and students have already used a computer and Web-browser to access the Internet; with Telecenter IP, a standard Web-browser is the only interface needed to access multimedia resources. Telecenter IP's ability to bridge the Mac/PC gap allows students and teachers to use the computer system they prefer. Telecenter IP works simultaneously and effortlessly in either environment; it doesn't matter what mix of Macs and PCs you have in your school.

Integrate, organize, collaborate, and involve

Telecenter IP supports teachers by allowing easy integration of media into their lessons. The PowerPoint Presentation Server helps teachers organize lessons and collaborate with their colleagues by sharing presentations. Students learn more when they are involved in all-page announcements of school news, create their own digital media and both create and present their own PowerPoint presentations.

Multimedia lessons

Flexible presentation and control options make it easy to create a multimedia lesson plan. From the familiar Web-browser interface, students or instructors can easily manage content, or switch among different media types. A hand-held remote control and on-screen display options mean you are never tied to the computer when instructing the class using Telecenter IP. Also, there is no need to use a different hand-held remote control to control each individual device, the Telecenter IP hand-held remote unifies control of all devices, from the local tv/projector to all of the media and PowerPoint presentations. On-screen navigation of the multimedia lesson plan, with instant feedback of control instructions (play, stop, scan, etc.), means the power of multimedia instruction is literally in the hands of the teacher.
